

ABSTRACT

In a staple case 1 provided with a staple pull-out opening 9 and a lower face opening 10, a roll staple S is contained, so that the staple case can be directly installed in a staple cartridge C. When the staple cartridge C is loaded in an electric stapler, a staple-feeding roller 12 is in contact with the roll staple S. As the staple-feeding roller rotationally drives the roll staple, a leading edge of the roll staple is fed to a leading edge of a guide portion 13 of the staple cartridge through the staple pull-out opening.
